Listing of Claims

Claims 1-40 (Cancelled)

41. (New) A method for providing a drawer guide for a drawer in a chamber through which there is a flow of liquid or gas at an elevated pressure, comprising the steps of:

providing a plurality of guide rails for said drawer guide, wherein one guide rail is associated with said drawer and another guide rail is associated with said chamber;

providing a rolling member assembly for guiding one of the guide rails in a displaceable manner on another guide rail in a direction of movement of the drawer;

providing a cage for the rolling members;

providing a rear rail portion on at least one of the guide rails, said rear rail portion including at least one partial section that extends in a direction of movement of the drawer and is provided with fluid passage openings in such a manner that a liquid or a gas present in said chamber is adapted to flow through the guide rail when the chamber is in use, and/or

providing a rear cage portion on said cage, said rear cage portion including at least one partial section that extends in the direction of movement of the drawer and is provided with fluid passage openings in such a manner that said liquid or a gas is adapted to flow through the cage when the chamber is in use.

42. (New) A method in accordance with claim 41, wherein:

a ratio of a surface area of the fluid passage openings in the guide rail to a total surface area of the rear rail portion in partial section amounts to at least approximately 20 %, and/or

a ratio of a surface area of the fluid passage openings in the cage to a total surface area of the rear cage portion in partial section amounts to at least approximately 20%.

43. (New) A method in accordance with claim 41, wherein:

a ratio of a surface area of the fluid passage openings in the guide rail to a total surface area of the rear rail portion in the partial section amounts to at most approximately 90 %, and/or

a ratio of a surface area of the fluid passage openings in the cage to a total surface area of the rear cage portion in the partial section amounts to at most approximately 90%.

44. (New) A method in accordance with claim 41, wherein at least one of the partial sections that is provided with fluid passage openings extends over at least one third of the length of the rear rail portion or the rear cage portion.

45. (New) A method in accordance with claim 41, wherein the sum of the lengths of the partial sections that are provided with fluid passage openings is greater than approximately two thirds of a total length of the rear rail portion or the rear cage portion.

46. (New) A method in accordance with claim 41, wherein at least one partial section of a guide rail comprises fluid passage openings whose lateral distance from at least one of the lateral edges of the associated rear rail portion is less than approximately a quarter of the width of the rear rail portion.

47. (New) A method in accordance with claim 41, wherein a pertinent partial section of the rear rail portion or that of the rear cage portion comprises at least three substantially congruent fluid passage openings.

48. (New) A method in accordance with claim 41, wherein the extent of each of the fluid passage openings in the rear rail portion or in the rear cage portion is at most approximately 5 mm in at least one of the directions in which it extends.

49. (New) A method in accordance with claim 41, wherein the extent of each of the fluid passage openings in the rear rail portion or in the rear cage portion is at most approximately 5 mm in the direction of movement of the drawer.

50. (New) A method in accordance with claim 41, wherein at least one guide rail of the drawer guide and at least one cage for the rolling members of the same drawer guide are provided with fluid passage openings.

51. (New) A method in accordance with claim 50, where when the drawer guide is pushed completely into an interior of said chamber, at least one fluid passage opening in the guide rail and at least one fluid passage opening in the cage for the rolling members are aligned with one another.

52. (New) A method in accordance with claim 41, wherein at least one guide rail of the drawer guide comprises a rolling member running track which is provided with at least one fluid passage opening.

53. (New) A method in accordance with claim 41, wherein at least one rolling member assembly of the drawer guide comprises rolling members in the form of balls.

54. (New) A method in accordance with claim 41, wherein at least one rolling member assembly of the drawer guide comprises rolling members which are each in single-point contact with a rolling member running track of a guide rail of the drawer guide that is associated with the rolling members.

55. (New) A method in accordance with claim 41, wherein the drawer guide comprises at least one further guide rail arranged between the guide rail associated with the drawer and the guide rail associated with the chamber.

56. (New) A method in accordance with claim 41, wherein the drawer guide allows the drawer to be withdrawn substantially completely from the interior of the chamber.

57. (New) A method in accordance with claim 41, wherein the chamber comprises a washing machine chamber.

58. (New) A method in accordance with claim 41, wherein the chamber comprises a dishwasher chamber.
